

Molt help and quality of farmed crustacean shell

AQUA TECHNA offers CALCI-S, an additive solution that provides nutrients necessary to maintain osmotic equilibrium during molting. It also allows quick hardening of the shell after molting.

CALCI-S contains:

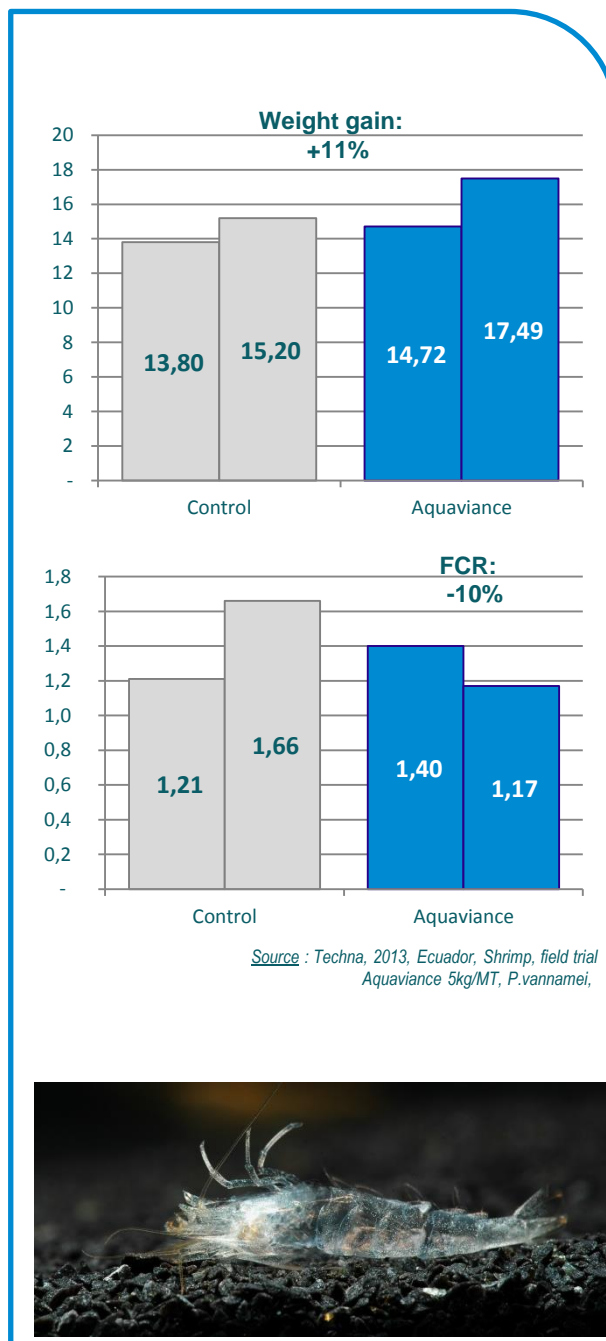

- **Essential minerals** for shell formation,
- **Vitamins** that contribute to a **better assimilation** of the essential minerals,
- **Osmoprotecting factors** contributing to fight osmotic stress during molting.

CALCI-S is an original additive solution that can be applied directly by the farmer through **coating on the feed**, by mixing it either into clear water or in quality fish oil, then spraying the mix on feed.

Use the preparation within 24/48h maximum.

It can also be used in feed by adding it after grinding together with other additives.

CALCI-S use is recommended during 7 days before molting and 7 days before harvest.

Use

Shrimp: 5kg/T feed
