

## Supporting the organ integrity during parasitic infection

Parasites are ubiquitous organisms of the aquatic environments. Their presence on the farm can lead to severe damages and economic losses.

Parasite management on farm must be taken in a large scale, with biosecurity and hygiene management measures.

Aquaneo has developed a dedicated range of product, **EpiShield**, based on plant extracts and micronutrients, to mitigate the impact of parasite by supporting the epithelial health and wound healing processes.

**EpiShield Gill** has been specially designed to help the farmers and fish during gill parasites infection. Based on the synergistic effects of:

- Medium chain fatty acids
- Plant extracts, including garlic essential oil.
- Micronutrients

**EpiShield Gill** can be added in the feed or by oil coating prior and during the contamination period:

- Prevention or moderate contamination : 2kg/T
- Weak animals or high contamination : 4kg/T

### Efficient parasites management measures

Adapted biosecurity and containment

### USE

Fish : From 2kg/T to 4kg/T depending on the level of threat.
