

CALCI-S

AQU002

Shrimp shell quality and osmotic stress control

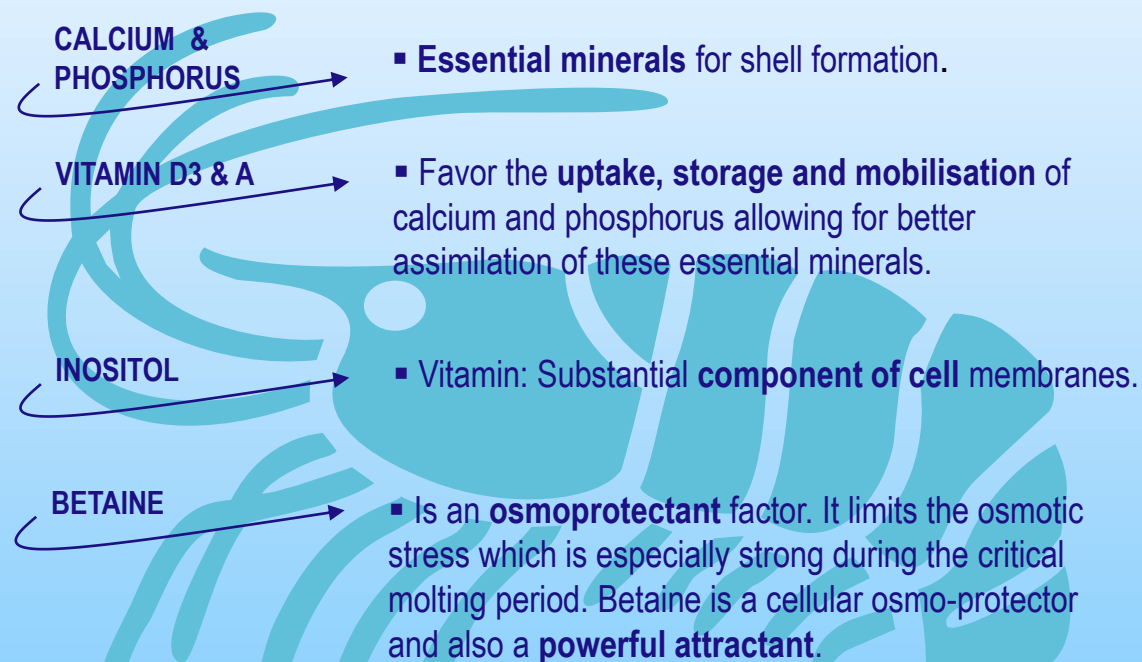

PROPERTIES

CALCI-S is a nutritional molt booster additive, that prevents phosphorus and calcium deficiencies occurring in low alkaline waters. **CALCI-S** is designed to improve the molt, help the shell harden, thereby favoring growth

CALCI-S limits the impact of osmotic shock on shrimp, especially when reared in high and low salinity waters or with low water exchange rates. Its original composition allows for improved osmotic balance and limits stress throughout the molting process.

COMPOSITION

DIRECTION OF USE

- **CALCI-S** is presented as powder.
- Recommended incorporation rate: 5 kg **CALCI-S** per ton of feed
- For coating in shrimp farm, mix 5 g **CALCI-S** per kilo of feed with 50/100ml of clean water then mix with the pellets, wait until liquid is absorbed then coat with a good quality fish oil.
- We recommend a daily use of **CALCI-S** every 7 days prior to the moulting period and before harvest.
- Store in a cool dry place
